

Generation-aligned Understanding

1. CBCT/CT Understanding

These two images are from the **same case**, with the **same slice index**, but different modalities. Could you **describe the transformation** from image 1 to image 2?

Suppress specific artifacts: scatter shading/cupping, ring artifacts, truncation, **cone-beam streaks/flare**.....

These images are from the **same slice** but different modalities. Could you **describe the transformation** from image 1 to image 2?

Imaging texture: Spatial resolution is below normal; near-black areas outside the body have a slight Poisson noise background.....

2. CT-PET Understanding

3. CT/MRI Understanding

Which option is the Brain slice in the **CT** modality that **matches the same slice index** as the **MRI** modality?

Option B

4. Modality Understanding

Four images are from **different medical imaging modalities**. For each panel, Could you **identify the imaging modality**?

["A" : "CT",
"B" : "CBCT",
"C" : "PET",
"D" : "T2 (MRI)"]

... Other Understanding

Tradition Understanding

1. Pathology Understanding

What type of stain is used in the image?

This image was created using H&E staining, also known as hematoxylin and eosin staining.

On this pano, is there adjacent root resorption from the impacted canine or any other urgent maxillary finding?

The impacted canine appears positioned above the dental arch without clear signs of root resorption in the adjacent teeth.

2. Oral Understanding

3. Fundus Understanding

The crescent-shaped loss of pigmentation and the difference in fluorescence make me feel serious. What should I do?

A crescent-shaped depigmented area near the foveola (the central retina responsible for sharp vision).

Paired Cross-Modality Data

Cross-modality synthesis between CT and MRI

Cross-modality synthesis between CBCT and CT

Cross-modality synthesis between different MRI

Cross-modality synthesis between CT and PET
